Phosphatase Assay Kit

(Cat. # 786-453)
INTRODUCTION
The Phosphatase Assay kit is designed to measure the activity of phosphatases in biological samples and to screen for agonists and inhibitors of phosphatases. The Phosphatase Assay kit uses para-nitrophenyl phosphate (pNPP), a chromogenic substrate for most phosphatases, including alkaline phosphatases, acid phosphatases, protein tyrosine phosphatases and serine/threonine phosphatases (Figure 1). The phosphatases remove the phosphate group to generate p-nitrophenol, which is deprotonated under alkaline conditions to produce p-nitrophenolate that has strong absorption at 405nm. The kit’s components are sufficient for performing up to 1000 assays in 96-well plate format and easily adaptable to cuvettes or 384-well plates.

ITEM(S) SUPPLIED (Cat. # 786-453)

<table>

<tr>
<th>Description</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>PA Substrate</td>
<td>50ml</td>
</tr>
<tr>
<td>PA Assay Buffer</td>
<td>50ml</td>
</tr>
</tbody>
</table>

STORAGE CONDITIONS
The kit is shipped at ambient temperature. Upon arrival, store at 4°C. The substrate is light sensitive and should be protected from direct sunlight or UV sources.

ADDITIONAL ITEMS REQUIRED
Stop Solution: 3N Sodium hydroxide (optional).

PROTOCOL

NOTE: The pH of the supplied assay buffer is 7.5, which is compatible with a large percentage of phosphatases, however for improved assay results use the following recommended assay buffers for acid and alkaline phosphatases.

- Acid Phosphatases: 0.1M sodium acetate (pH5.5) and 10mM MgCl₂
- Alkaline Phosphatase: 0.1M Tris.HCl (pH 8.6) and 10mM MgCl₂

1. Equilibrate the substrate and assay buffer to room temperature before use.
2. Make appropriate serial dilutions of your test samples with PA Assay Buffer. Prepare enough solution to perform assays in triplicate.
3. Transfer 50μl diluted test samples to wells in a 96-well plate. In addition, use 50μl PA Assay Buffer without enzyme for blank wells.
4. Start the reaction with the addition of 50μl PA Substrate to each well.
5. Incubate for 10-30 minutes at room temperature.
   Note: For dynamic assay, measure the absorbance every minute at 405nm.
6. At the end of the incubation, add 50μl Stop Solution to each well to stop the reaction.
7. Measure the absorbance at 405nm.
ENZYME ACTIVITY CALCULATION:
Calculate the average of the triplicate assays and subtract the average of the blank wells.

Enzyme activity (nmoles/min/μg) = \( \frac{OD_{405nm} \times V}{(\epsilon \times T \times L \times E)} \)

- \( OD_{405nm} \) = mean absorbance of sample minus mean absorbance of blank
- \( V \) = reaction volume (l)
- \( \epsilon \) = extinction coefficient of p-nitrophenol (17.8 mM\(^{-1}\)cm\(^{-1}\))
- \( T \) = Incubation time (min)
- \( L \) = pathlength of light (cm)
- \( E \) = enzyme (μg)
